

Hello, and welcome to November. Hope you do not have too much of a stomach ache from all the Halloween treats. As it is getting colder make sure that your worms are somewhere warm (avoid outside doors or exterior walls that get really cold). If you are needing your worm bin looked at and have not heard for the Worm Lady in awhile let her know so that she can book a worm bin check up. WWFN (Wiggle Wiggle for now!)

What's the difference?

How are the worms in the garden different from the worms that live in your bin? To start with you have red wiggler worms in your bin and in your garden you will most often find dew worms. The dew worms are much bigger than your red wigglers and live in a different way. If your red wigglers were living in your garden they would only be in the top part of the soil whereas your garden worms like to live much deeper and only come up once and awhile (like when there has been a lot of rain). Also the dew worms are not as much of a fan of carrots and banana peels as your red wigglers. Instead they like leaves and sticks (and oatmeal but that is a very rare treat). Do you remember what your red wigglers favorite food is? That is right cake and all of your lunch time leftovers. That is why we use red wigglers instead of dew worms. They like our food and we can create a comfortable habitat for them in the worm bin. If we were to put dew worms in there they would not like because there are too many vibrations and the soil is too fluffy.

Did you know

In nature a redwiggler normally does not live longer than a year, but in your worm bin they can live up to 8 years! That means that some of the worms in your bin may have visited your school before!
